

CaloTracko [Allodge]

CaloTracko v1

Hey friends, is Singapore's nightlife dying down? On the contrary, what's with all the Hyrox and marathon craze today? Are Gen-Zs just getting more health-conscious?

Probably.

Well... if you're someone who's also trying to keep your health in check, we'd love to introduce a new buddy to you: CaloTracko!

Isn't it so cute! (say yes)

Created by Sean Koh from AI Lodge, CaloTracko is an AI-powered calorie tracking Telegram bot that makes meal logging as simple as sending a food photo or text description!

Users can track their nutrition through these commands:

 [/log](#) — Log a meal \ (text or photo\)

 [/today](#) — Check today's progress

 [/week](#) — See weekly history

 [/profile](#) — View or update your settings

 [/saved](#) — Browse your saved meals

 [/goal](#) — View or set your calorie goal

 [/history](#) — View a past date

 [/reminder](#) — Set meal reminders

Built with Python, FastAPI, OpenAI's GPT-4o-mini, Vercel, and Supabase, CaloTracko uses AI to estimate calories and macronutrients. It also calculates a personalised daily calorie goal and keeps a record of past meals so users can track their progress over time. Features like 'Saved Meals' and conversational follow-ups make logging easier by letting users reuse commonly eaten meals and provide extra details.

You see, Sean created CaloTracko after finding traditional apps tedious to use. Logging meals often required manually searching food databases and entering detailed information, making it difficult to stay consistent. While some apps offered photo analysis (e.g. "MealScan"), these features were typically locked behind premium subscriptions. That's when he thought: isn't this something ChatGPT/Gemini could also do through a photo upload? What if he created a simple interface that used AI APIs to analyse images while automatically logging the nutritional data?

The project ended up working better than he expected, being able to identify even multiple foods from a single image. However, there are still some accuracy issues for the calorie estimation, which is expected.

Sean's main takeaway? While GPT-4o is incredibly smart at identifying what is on the plate, a 2D photo has no depth perception. A potential future improvement would be integrating smartphone LiDAR sensors to capture 3D volume data and improve calorie estimation accuracy.

Storie [AILodge]

Storie v1

What if you could be the main character of your own story? Say hi to: Storie! 📖✨

Create Your Storybook

Enter a story idea and we'll create a magical bedtime story

CHILD'S NAME

e.g., Emma

STORY IDEA

e.g., A brave little toaster gets lost in the forest but makes friends with a squirrel

VISUAL STYLE

Watercolor

Create Story

Created by Samuel Tan, Storie is an AI-powered storybook generator. It creates personalised stories for you with custom illustrations (you can choose between Watercolour, Pastel, Digital Art, and more)!

Prompt → AI generates the story and artwork → Fully illustrated storybook

The result is a personalised reading experience that can be generated in just minutes for you, your friends, or any kids!

Samuel created Storie as an experiment to explore how AI workflows and text-to-image generation could be combined to serve a meaningful purpose. The goal was to bring them together into a complete storybook experience that children could enjoy before bedtime.

He found the project successful. However, the quality of the generated illustrations was largely constrained by the image generation model being used. In the future, Sam would like to spend more time planning a project out before diving straight into coding, making the overall development process smoother.

Tech Stack:

Frontend: React 19 + Vite 7

Styling: Tailwind CSS 3.4

Routing: React Router 7

Backend: InsForge BaaS (Database, Storage, AI)

AI Story Generation: OpenAI GPT-4o-mini

AI Image Generation: Wavespeed AI

GitHub Repository: <https://github.com/tancysam/Storie>

Enhance AI [AILodge]

Enhance AI v1

What would you look like when combined with Trump's face? Or the Rock?

(gif)

...

Yashwanth created Enhance AI to let you do just that! 😊

It is an AI-powered photo enhancement platform that lets you play around with different filters and effects. From turning yourself into a child to trying out celebrity-inspired looks, it's easy to generate entertaining results with just a few clicks. As an extra touch, users can simply scan a QR code to receive their images on Telegram. Simple, interactive, and fun!

The project originally started with a much simpler idea: creating an AI tool that could merge two people's faces to show what the result might look like. As development progressed, the concept expanded into a collection of AI-powered filters, face morphers, and sharing features, turning it into a much more complete photo playground.

The screenshot shows the 'Future Kid' web application interface. At the top, the title 'Future Kid' is displayed in green, followed by the instruction 'Upload two parent photos and see what their child would look like.' Below this, there are two large dashed green boxes for uploading photos, labeled 'Person A' and 'Person B'. Each box contains a green circle with a white plus sign and the text 'Click or drag photo'. To the right of each box is a camera icon. Below the upload area, there are two columns of feature selection buttons. The left column includes 'Age' (Baby, Kid, Adult), 'Hair length' (Any, Short, Medium, Long), 'Eye size' (Natural, Small, Large), 'Ear size' (Natural, Small, Large), and 'Jawline' (Natural, Soft, Defined). The right column includes 'Gender' (Any, Boy, Girl), 'Skin tone' (Blend, Light, Medium, Dark), 'Nose size' (Natural, Small, Large), and 'Cheekbones' (Natural, Subtle, Defined). At the bottom, there is a large green button labeled 'Generate Kid'.

One of his biggest takeaways from building Enhance AI was learning how important prompt engineering is for image generation. Small changes to prompts can produce dramatically different outputs, making prompt design just as important as the underlying AI model itself.

Tech Stack: Python for backend and used an API key for image generation
